

GoOutside Retail Partnership Dashboard

Complete Presentation Script — Approximately 3 Minutes

Opening

Hello everyone.

Today, I'm presenting the dashboard I prepared for Dustin, Head of Retail Partnership.

The main goal of this dashboard is to help Dustin understand **how the different markets are structured**, identify important retailers, and decide **where and how GoOutside should focus its growth efforts**.

I'll explain how Dustin can use the dashboard step by step to support his retail partnership decisions.

Page 1 – Dashboard Overview

Let's start with the first page.

This page gives Dustin an interactive overview of the sales data.

He can filter the dashboard by **year, country, retailer name, product, product line, and brand**.

For example, he can select a specific year and country, and then focus on a particular retailer, product, product line, or brand.

The dashboard then updates the key figures, including **total sales, sales quantity, price, and percentage contribution**.

Dustin can also click directly on a specific part of the graph for a **product, product line, or brand** to focus on that selection and explore the related information.

The table can also be sorted by **sales, quantity, or price**.

So, this first page helps Dustin **explore the data and identify areas that require a closer look**.

Page 2 – Market Overview

On page two, Dustin can use the **Year filter** to select the period he wants to analyze.

This page gives him an overview of the different markets where GoOutside operates.

An important part of this page is the **map**.

Each market is represented by a bubble, and the bubble shows the **number of retailers and the total sales** for that market.

This allows Dustin to quickly compare markets based on both their sales volume and their retailer network.

For example, if a market has **high total sales but only a small number of retailers**, this could indicate that sales are concentrated among a few large retailers.

On the other hand, if a market has **many retailers with sales distributed across them**, this indicates a more fragmented and competitive market.

So, this page helps Dustin understand **how each market is structured**, which is important for deciding what type of growth strategy to use.

Page 3 – Retailer Sales Overview

On page three, Dustin can focus on the **individual retailers and their sales performance**.

The page shows three key pieces of information: **retailer name, country, and total sales**.

This allows Dustin to identify which retailers generate the highest sales and in which countries they operate.

By comparing the total sales of the different retailers, Dustin can identify the **big players** that have the greatest impact on the market.

For these important retailers, the strategy is to focus on **strengthening the existing partnerships** and increasing their sales.

The target is a **10% increase in sales volume per retailer**.

So, this page helps Dustin identify **which specific retailers should receive more attention and where the biggest sales opportunities are**.

Page 4 – Overall Sales Growth

Page four gives Dustin a broader view of **overall sales growth**.

There is no filter on this page.

The purpose is to understand how sales are developing across the different markets and to identify markets with stronger or weaker growth.

Dustin can use this information together with the market structure from the previous pages.

For example, a market may have strong sales but relatively slow growth.

Another market may be smaller but growing quickly.

This helps Dustin understand **where the business is developing positively and where additional attention may be needed.**

Page 5 – Sales Growth by Retailer

On page five, Dustin can analyze **sales growth for each individual retailer.**

There are three filters on this page: **Year, Retailer Name, and Country.**

For example, Dustin can select a specific year, choose a retailer, and then select a country.

The graph shows the **sales growth of that retailer**, allowing Dustin to see whether the retailer's sales are increasing, decreasing, or remaining relatively stable.

This is useful for evaluating existing retail partnerships.

Dustin can identify which retailers are performing well and which retailers may need more attention.

For markets dominated by big players, he can use this information to identify the retailers with the greatest potential and work toward the **10% increase in sales volume per retailer.**

Page 6 – Growth in Number of Retailers

Finally, on page six, Dustin can look at the **growth in the number of retailers.**

This is especially important for markets where sales are distributed across many retailers.

By looking at the development of the retailer number, Dustin can see whether the retailer network is expanding or whether the market is becoming more stable or concentrated.

For a more fragmented and competitive market, the objective is to **increase the number of retailers by 15%.**

This means Dustin can use this page to evaluate whether GoOutside is moving toward the desired growth in its retailer network.

Together with the previous pages, this gives Dustin a clear decision process:

First, understand the market structure.

Second, identify the important retailers and their total sales.

Third, analyze overall sales growth and individual retailer sales growth.

And finally, look at the growth of the retailer network.

If the market is dominated by big players, the focus should be on **strengthening existing partnerships**

and achieving a 10% increase in sales volume per retailer.

If the market is more fragmented, the focus should be on **expanding the retailer network and achieving a 15% increase in the number of retailers.**

So, the dashboard helps Dustin move from **understanding the market to identifying the right growth strategy.**

Thank you.
